

A host (SSP, DSP, or exchange) deploys an OCI container in its own infrastructure. The agent returns an OpenRTB Patch. The orchestrator accepts or rejects each mutation. OpenRTB still moves the auction.

ARTF checks that the call succeeded. It does not check that the auction is still legal OpenRTB after the write. The orchestrator may accept. Nothing in the spec asks the object.

OPENRTB AUCTION

framework accepted the RPC

BidRequest

legal when it arrived

`imp · deals · segments`

Agent patch

well-formed ARTF

orchestrator may accept it

BidRequest'

the object every buyer would see

`still called OpenRTB · no longer valid OpenRTB`

Wrong stage

BID_SHADE on a publisher BidRequest. Shading belongs after a bid.

`wrong lifecycle · nothing to shade`

Wrong object

The path names an impression this auction does not have.

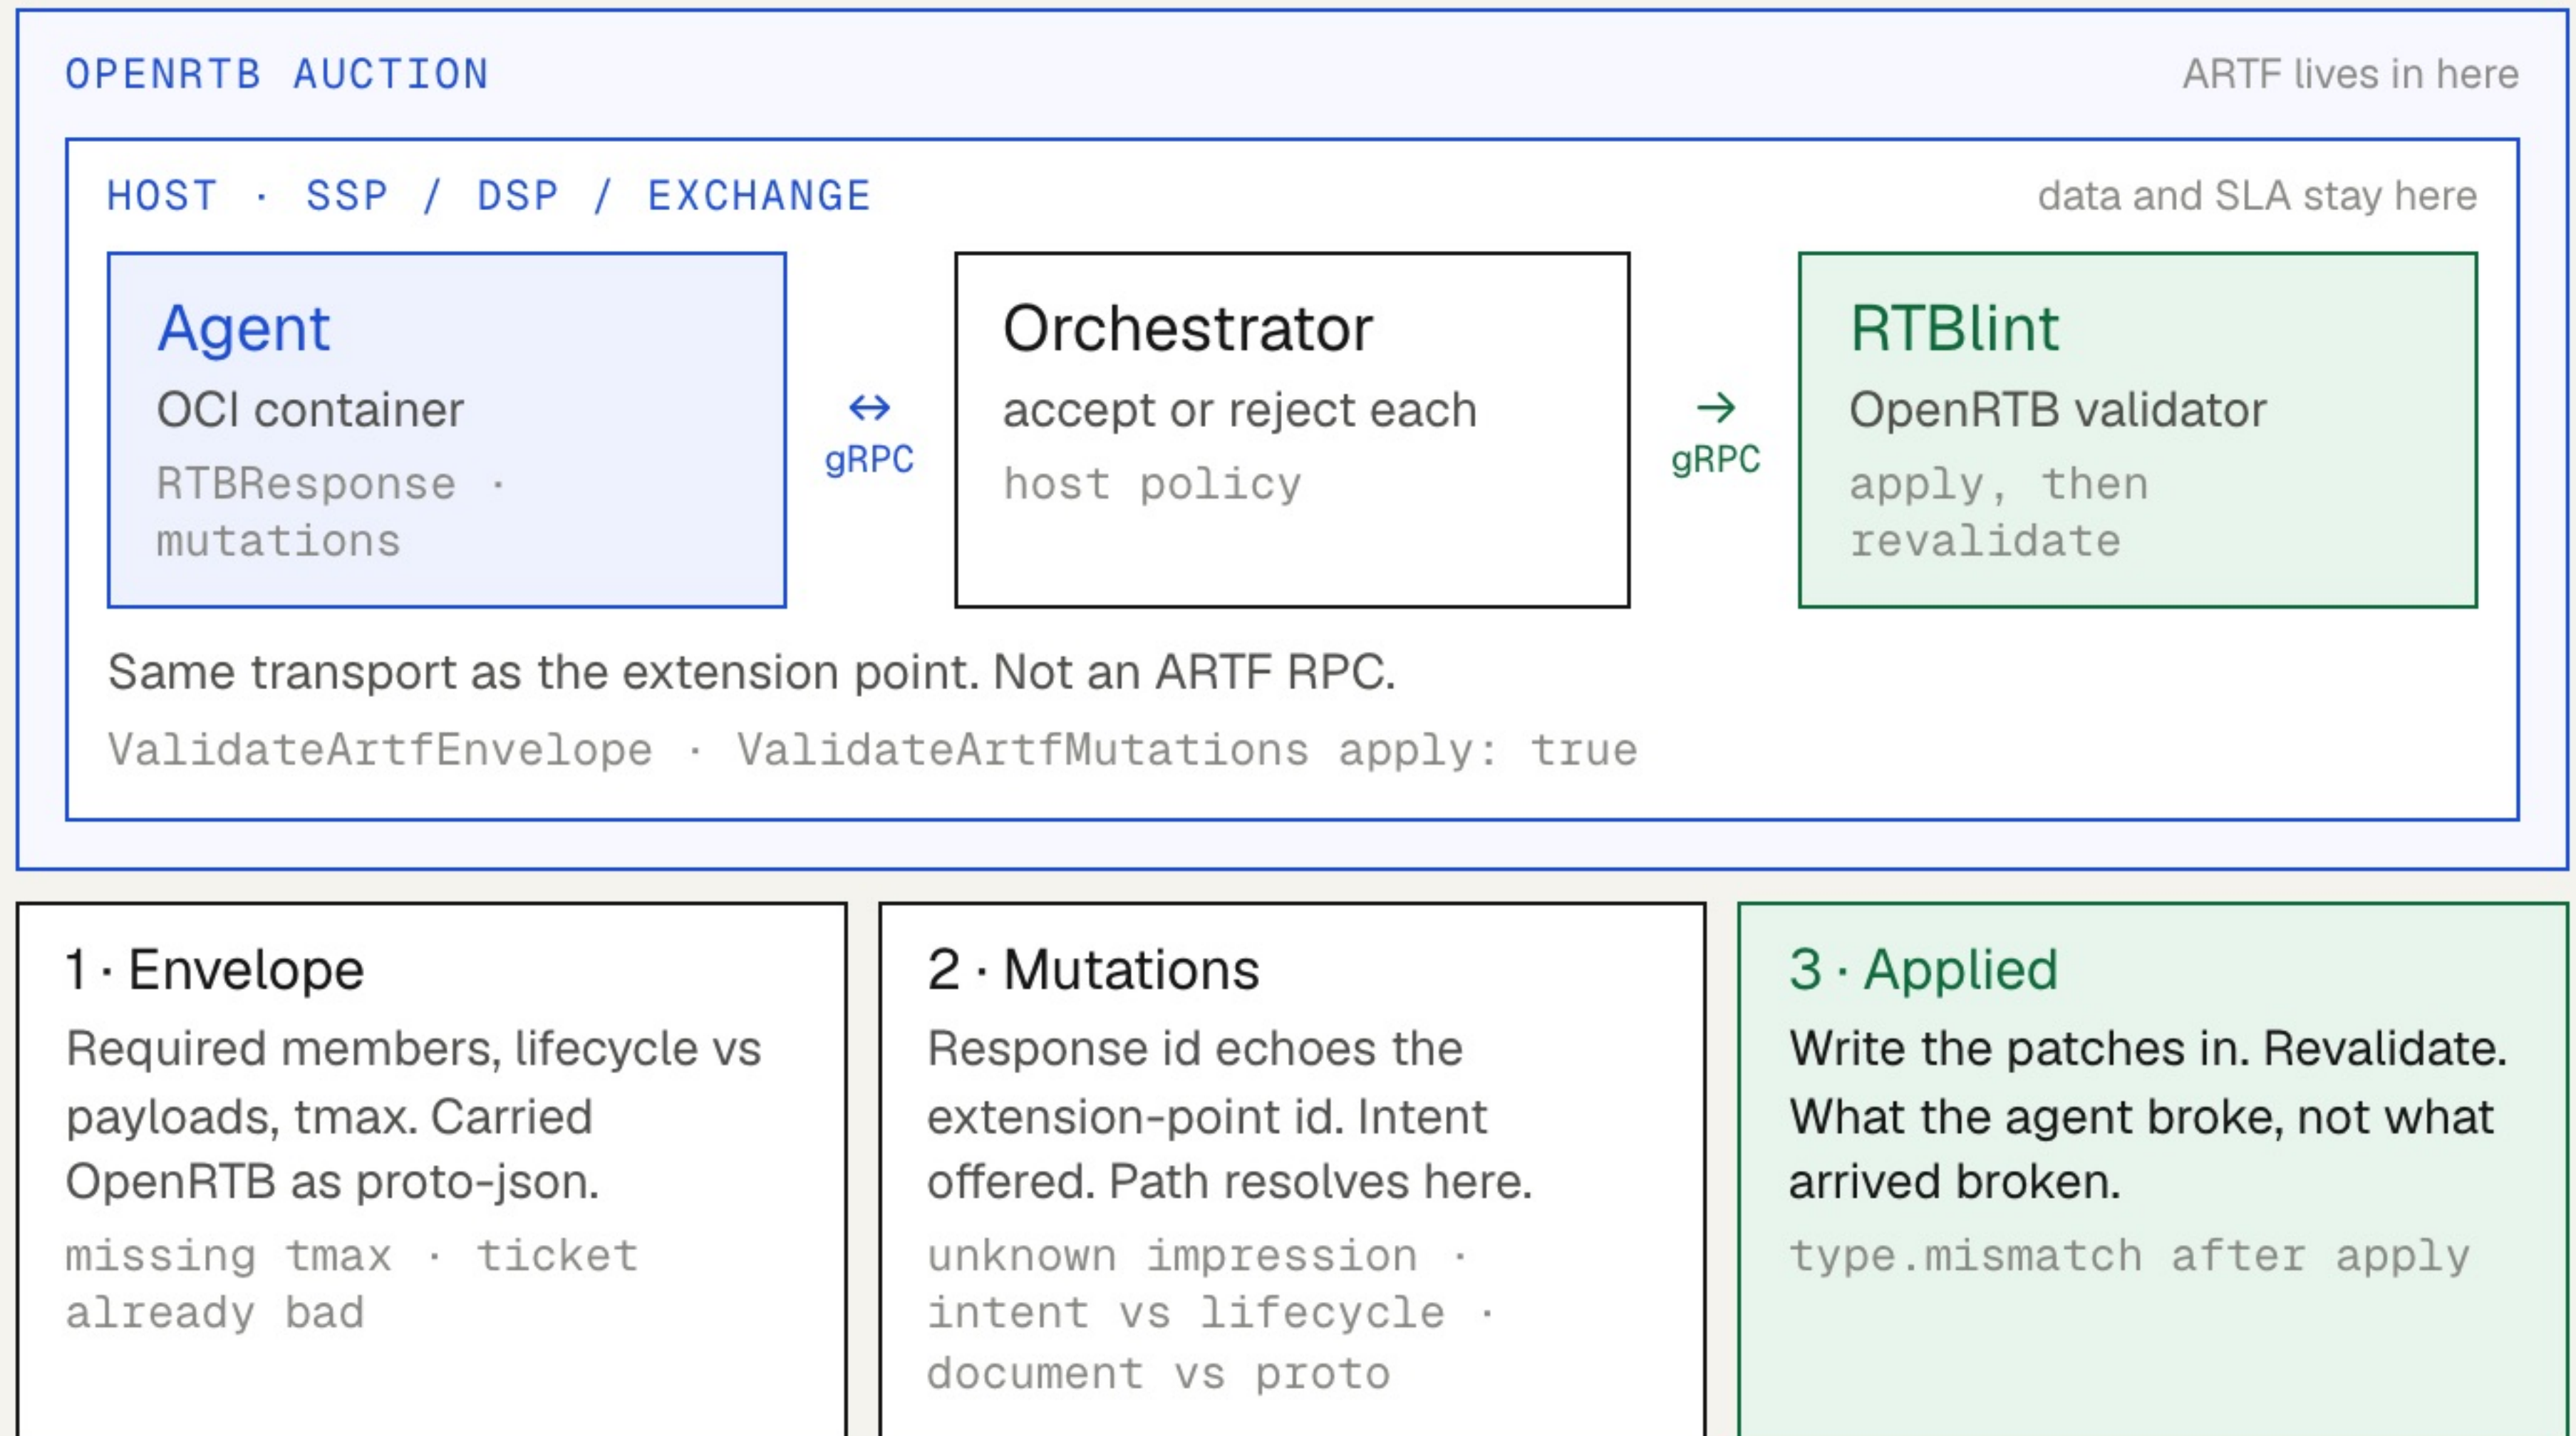

`/imp/imp-404 · write into nothing`

Legal ARTF, illegal OpenRTB

ADD_METRICS is well-formed. viewability lands as "high". OpenRTB wants a number.

`the mutation the spec would allow`

RTBlint asks the question ARTF does not: is the auction still legal OpenRTB after the patch?
Before fanout, and before a shaded bid is accepted.

RTBlint is an OpenRTB validator. It checks that the auction is still legal after a patch, before the host forwards. rtblint.org

RTBlint does not rewrite the BidRequest. A finding holds the whole set: the DSP never sees it. Empty list: buyers bid on the auction the agent actually wrote.

REJECT

do not forward

`artf.mutation.intent_not_applicable`

BID_SHADE on a publisher BidRequest.

shading belongs after a bid

`artf.mutation.imp_unknown`

/imp/imp-404 is not on this ticket.

write into nothing

`openrtb.type.mismatch`

viewability landed as "high", not a number.
